

# DRV10983-Q1 Automotive, Three-Phase, Sensorless BLDC Motor Driver

## 1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results:
  - Device Temperature Grade 1: –40°C to 125°C Ambient Operating Temperature Range
  - Device HBM ESD Classification Level 1C
  - Device CDM ESD Classification Level C4A
- Operation Voltage Range:
  - Motor Operation, 6.2 V to 28 V
  - Register Setting Preserved, 4.5 V to 45 V
- Supports Load Dump Voltage up to 45 V
- Total Driver H + L  $r_{DS(on)}$ 
  - 250 mΩ at  $T_A = 25^\circ\text{C}$
  - 325 mΩ at  $T_A = 125^\circ\text{C}$
- Drive Current: 2-A Continuous Winding Current (3-A Peak)
- Configurable Output PWM Slew Rate and Frequency for EMI Management
- Sensorless Proprietary Back Electromotive Force (BEMF) Control Scheme (No Need of Hall Sensors)
- Continuous Sinusoidal 180° Commutation
- Initial Position-Detect Algorithm to Avoid Back Spin During Start-Up
- No External Sense Resistor Required
- Flexible User Interface Options:
  - I<sup>2</sup>C Interface: Access Registers for Command and Feedback
  - Dedicated SPEED Pin: Accepts Either Analog or PWM Input
  - Dedicated FG Pin: Provides TACH Feedback
  - Spin-Up Profile Can Be Customized With EEPROM
  - Forward-Reverse Control With DIR Pin
- Integrated Buck Converter to Efficiently Provide 5-V and 3.3-V LDOs for Internal and External Circuits
- Supply Current 8.5 mA With Standby Version (DRV10983SQ)
- Supply Current of 48 μA With Sleep Version (DRV10983Q)
- Protection Features
  - Overcurrent Protection (Protection for Phase-to-Phase, Phase-to-GND and Phase-to-V<sub>CC</sub> Shorts
  - Lock Detection

- Anti-Voltage Surge (AVS) Protection
- UVLO Protection
- Thermal Shutdown Protection
- Thermally Enhanced Package

## 2 Applications

- Small Automotive Pumps and Fans
- Seat Ventilation Fans
- Motorcycle Fuel Pumps
- HEV Battery Cooling Fans

## 3 Description

The DRV10983-Q1 device is a 3-phase sensorless motor driver with integrated power MOSFETs, which can provide continuous drive current up to 2 A. The device is specifically designed for cost-sensitive, low-noise, low-external-component-count fan and pump applications.<sup>TM</sup>

The DRV10983-Q1 device preserves register setting down to 4.5 V and delivers current to the motor with supply voltage as low as 6.2 V. If the power supply voltage is higher than 28 V, the device stops driving the motor and protects the DRV10983-Q1 circuitry. This function is able to handle a load dump condition up to 45 V.

### Device Options:

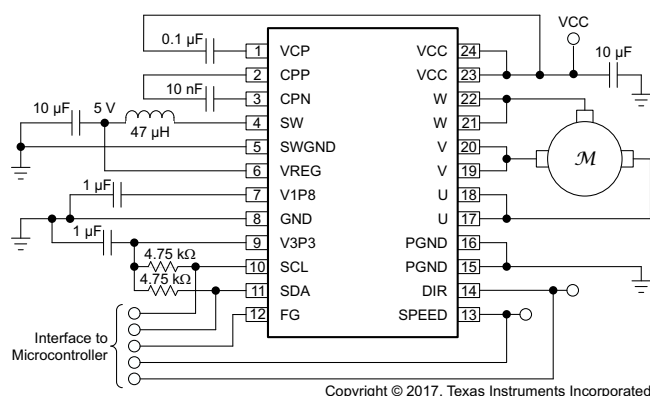

- DRV10983Q: Sleep Version
- DRV10983SQ: Standby Version

### Device Information (1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DRV10983-Q1	HTSSOP (24)	7.80 mm x 6.40 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

DATE	REVISION	NOTES
June 2017	*	Initial release

## 5 Description (Continued)

The DRV10983-Q1 device uses a proprietary sensorless control scheme to provide continuous sinusoidal drive, which significantly reduces the pure tone acoustics that typically occur as a result of commutation. The interface to the device is designed to be simple and flexible. The motor can be controlled directly through PWM, analog, or I<sup>2</sup>C inputs. Motor speed feedback is available through both the FG pin and the I<sup>2</sup>C interface simultaneously.

The DRV10983-Q1 device features an integrated buck regulator to step down the supply voltage efficiently to 5 V for powering both internal and external circuits. The 3.3-V LDO also may be used to provide power for external circuits. The device is available in either a sleep mode or a standby mode version to conserve power when the motor is not running. The standby mode (8.5 mA) version (DRV10983SQ) leaves the regulator running and the sleep mode (48 µA) version (DRV10983Q) shuts the regulator off. Use the standby mode version in applications where the regulator is used to power an external microcontroller. Throughout this data sheet, the DRV10983-Q1 part number is used for both devices i.e. DRV10983Q (sleep version) and DRV10983SQ (standby version), except for specific discussions of sleep vs standby functionality.

An I<sup>2</sup>C interface allows the user to reprogram specific motor parameters in registers and to program the EEPROM to help optimize the performance for a given application. The DRV10983-Q1 device is available in a thermally-efficient HTSSOP, 24-pin package with an exposed thermal pad. The operating ambient temperature is specified from –40°C to 125°C.

## 6 Pin Configuration and Functions

PWP PowerPAD™ Package  
24-Pin HTSSOP With Exposed Thermal Pad  
Top View

### Pin Functions

PIN		TYPE (1)	DESCRIPTION
N/AME	HTSSOP		
CPN	3	P	Charge pump pin 1, use a ceramic capacitor between CPN and CPP
CPP	2	P	Charge pump pin 2, use a ceramic capacitor between CPN and CPP
DIR	14	I	Direction; When low, phase driving sequence is U → V → W When high, phase driving sequence is U → W → V
FG	12	O	FG signal output indicates speed of motor
GND	8	P	Digital and analog ground
PGND	15, 16	P	Power ground
SCL	10	I	I <sup>2</sup> C clock signal
SDA	11	I/O	I <sup>2</sup> C data signal
SPEED	13	I	Speed control signal for PWM or analog input speed command
SW	4	O	Step-down regulator switching node output
SWGND	5	P	Step-down regulator ground
U	17, 18	O	Motor U phase
V	19, 20	O	Motor V phase
V1P8	7	P	Internal 1.8-V digital core voltage. V1P8 capacitor must connect to GND. This is an output, but is not specified to drive external loads.
V3P3	9	P	Internal 3.3-V supply voltage. V3P3 capacitor must connect to GND. This is an output and may drive external loads not to exceed I <sub>V3P3_MAX</sub> .
V <sub>CC</sub>	23, 24	P	Device power supply
VCP	1	P	Charge pump output, use a ceramic capacitor between VCP and V <sub>CC</sub>
VREG	6	P	Step-down regulator output and feedback point
W	21, 22	O	Motor W phase
Thermal pad (GND)	—	P	The exposed thermal pad must be electrically connected to the ground plane by soldering to the PCB for proper operation, and connected to the bottom side of the PCB through vias for better thermal spreading.

(1) I = Input, O = Output, I/O = Input/output, NC = No connect, P = Power

## 7 Specifications

### 7.1 Absolute Maximum Ratings

 over operating ambient temperature range <sup>(1)</sup>

		MIN	MAX	UNIT
Input voltage <sup>(2)</sup>	V <sub>CC</sub>	-0.3	28	V
	V <sub>CC</sub> during load dump (V <sub>CC</sub> slew rate < 1 V/μs)	-0.3	45	
	SPEED	-0.3	4	
	PGND, SWGND	-0.3	0.3	
	SCL, SDA	-0.3	4	
	DIR	-0.3	4	
Output voltage <sup>(2)</sup>	U, V, W	-1	30	V
	SW	-1	30	
	VREG	-0.3	7	
	FG	-0.3	4	
	VCP	-0.3	V <sub>CC</sub> + 6	
	CPN	-0.3	30	
	CPP	-0.3	V <sub>CC</sub> + 6	
	V3P3	-0.3	4	
V1P8	-0.3	2.5		
T <sub>J_MAX</sub>	Maximum junction temperature	-40	150	°C
T <sub>stg</sub>	Storage temperature	-55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to the ground terminal (GND) unless otherwise noted.

### 7.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per AEC Q100-002, all pins <sup>(1)</sup>	±2000
		Charged device model (CDM), per AEC Q100-011, all pins	±750

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 7.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
Supply voltage	V <sub>CC</sub> , register contents preserved	4.5	12	45	V
	V <sub>CC</sub> , motor operational	6.2	12	28	
Voltage range	U, V, W	-0.7		29	V
	SCL, SDA, FG, SPEED, DIR	-0.1	3.3	3.6	
	PGND, GND, SWGND	-0.1		0.1	
	VCP, CPP	-0.1		V <sub>CC</sub> + 5	
	CPN	-0.1		V <sub>CC</sub>	
	SW	-0.7		V <sub>CC</sub>	
Current range	Step-down regulator output current (buck mode)			100	mA
	Step-down regulator output current (resistive mode)			5	
	V3P3 LDO output current (no load on VREG and V3P3 in resistive mode)			5	
T <sub>A</sub>	Operating ambient temperature	-40		125	°C

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		DRV10983-Q1	UNIT
		PWP (HTSSOP)	
		24 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	36.1	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	17.4	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	14.8	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.4	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	14.5	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	1.1	°C/W

(1) For more information about traditional and new thermal metrics, see [Semiconductor and IC Package Thermal Metrics](#).

## 7.5 Electrical Characteristics

over operating voltage and ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>SUPPLY CURRENT (DRV10983Q)</b>						
$I_{VCCSLEEP1}$	Sleep current	$V_{SPEED} = 0\text{ V}$ ; $V_{CC} = 12\text{ V}$ ; $T_A = 25^\circ\text{C}$		48	54	$\mu\text{A}$
		$V_{SPEED} = 0\text{ V}$ ; $V_{CC} = 12\text{ V}$ ; across temperature			81	
$I_{VCC}$	Active current	$V_{SPEED} > 0\text{ V}$ ; buck regulator with inductor; no motor load		10	15	mA
		$V_{SPEED} > 0\text{ V}$ ; buck regulator with resistor; no motor load		13	16	
<b>SUPPLY CURRENT (DRV10983SQ)</b>						
$I_{VCCSTBY}$	Standby current	$V_{SPEED} = 0\text{ V}$ ; buck regulator with inductor		8.5	14	mA
		$V_{SPEED} = 0\text{ V}$ ; buck regulator with resistor		11	15	
$I_{VCC}$	Active current	$V_{SPEED} > 0\text{ V}$ ; buck regulator with inductor; no motor load		10	15	mA
		$V_{SPEED} > 0\text{ V}$ ; buck regulator with resistor; no motor load		13	16	
<b>UVLO</b>						
$V_{UVLO\_R}$	UVLO rising threshold voltage		5.8	6	6.2	V
$V_{UVLO\_F}$	UVLO falling threshold voltage		5.6	5.8	6	V
$V_{UVLO\_HYS}$	UVLO threshold voltage hysteresis		170	195	220	mV
$V_{V1P8\_UVLO\_R}$	V1P8 UVLO rising threshold		1.5	1.6	1.7	V
$V_{V1P8\_UVLO\_F}$	V1P8 UVLO falling threshold		1.4	1.55	1.65	V
$V_{V3P3\_UVLO\_R}$	V3P3 UVLO rising threshold		2.7	2.85	2.95	V
$V_{V3P3\_UVLO\_F}$	V3P3 UVLO falling threshold		2.5	2.7	2.8	V
$V_{VREG\_UVLO\_R}$	VREG UVLO rising threshold		4	4.2	4.3	V
$V_{VREG\_UVLO\_F}$	VREG UVLO falling threshold		3.9		4.2	V
<b>LDO OUTPUT</b>						
V3P3	Output voltage	Buck regulator with inductor, 20-mA load	3.1	3.3	3.5	V
		Buck regulator with resistor, no load				
$I_{V3P3\_MAX}$	Maximum load from V3P3	Only with inductor mode of buck operation, with resistor mode no load			20	mA
V1P8	Output voltage	No load	1.7	1.8	1.9	V
<b>STEP-DOWN REGULATOR</b>						
$V_{REG}$	Regulator output voltage	$L_{SW} = 47\ \mu\text{H}$ , $C_{SW} = 10\ \mu\text{F}$ $I_{load} = 100\ \text{mA}$	4.5	5	5.5	V
		$R_{SW} = 39\ \Omega$ , $C_{SW} = 10\ \mu\text{F}$ $I_{load} = 5\ \text{mA}$				
$I_{REG\_MAX\_L}$	Maximum load from $V_{REG}$ in switching mode	$L_{SW} = 47\ \mu\text{H}$ , $C_{SW} = 10\ \mu\text{F}$			100	mA
$I_{REG\_MAX\_R}$	Maximum load from $V_{REG}$ in linear mode	$R_{SW} = 39\ \Omega$ , $C_{SW} = 10\ \mu\text{F}$			5	mA
<b>INTEGRATED MOSFET</b>						
$r_{DS(ON)}$	Series resistance (H + L)	$T_A = 25^\circ\text{C}$ ; $V_{(VCC)} > 6.5\text{ V}$ ; $I_o = 1\ \text{A}$		250	400	m $\Omega$
		$T_A = 125^\circ\text{C}$ ; $V_{(VCC)} > 6.5\text{ V}$ ; $I_o = 1\ \text{A}$		325	550	

**Electrical Characteristics (continued)**

over operating voltage and ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>SPEED – ANALOG MODE</b>						
V <sub>AN/A_FS</sub>	Analog full-speed voltage		V <sub>(V3P3)</sub> × 0.9		V <sub>(V3P3)</sub>	V
V <sub>AN/A_ZS</sub>	Analog zero-speed voltage		0		100	mV
t <sub>SAM</sub>	Sampling period for analog voltage on SPEED pin			320		μs
V <sub>AN/A_RES</sub>	Analog voltage resolution			6.5		mV
<b>SPEED – PWM DIGITAL MODE</b>						
V <sub>DIG_IH</sub>	PWM input high voltage		2.2			V
V <sub>DIG_IL</sub>	PWM input low voltage				0.6	V
f <sub>PWM</sub>	PWM input frequency		0.1		100	kHz
<b>SLEEP/STANDBY CONDITION</b>						
V <sub>EN_SL_SB</sub>	Analog voltage to enter sleep/standby	SpdCtrlMd = 0 (analog mode)			100	mV
V <sub>EX_SL</sub>	Analog voltage to exit sleep	SpdCtrlMd = 0 (analog mode)	2.2			V
V <sub>EX_SB</sub>	Analog voltage to exit standby	SpdCtrlMd = 0 (analog mode)	0.17		3.3	V
t <sub>EX_SL</sub>	Time to exit from sleep mode	SpdCtrlMd = 0 (analog mode) V <sub>SPEED</sub> > V <sub>EX_SL</sub>		2		μs
t <sub>EX_SB</sub>	Time to exit from standby mode	SpdCtrlMd = 0 (analog mode) V <sub>SPEED</sub> > V <sub>EX_SB</sub>		700	800	ms
t <sub>EX_SL_SB</sub>	Time to exit from sleep or standby condition	SpdCtrlMd = 1 (PWM mode) V <sub>SPEED</sub> > V <sub>DIG_IH</sub>		2		μs
t <sub>EN_SL_SB</sub>	Time to enter sleep or standby condition	SpdCtrlMd = 1 (PMW mode) V <sub>SPEED</sub> < V <sub>DIG_IL</sub>		60		ms
<b>DIGITAL I/O (DIR INPUT, FG OUTPUT )</b>						
V <sub>DIR_H</sub>	Input high		2.2			V
V <sub>DIR_L</sub>	Input low				0.6	V
V <sub>FG_OH</sub>	Output high voltage I <sub>o</sub> = 5 mA			3.3		V
V <sub>FG_OL</sub>	Output low voltage I <sub>o</sub> = 5 mA				0.6	V
<b>I<sup>2</sup>C SERIAL INTERFACE</b>						
V <sub>I2C_H</sub>	Input high		2.2			V
V <sub>I2C_L</sub>	Input low				0.6	V
f <sub>I2C</sub>	I <sup>2</sup> C clock frequency		0		400	kHz
<b>LOCK DETECTION RELEASE TIME</b>						
t <sub>LOCK_OFF</sub>	Lock release time			5		s
t <sub>LCK_ETR</sub>	Lock enter time			0.3		s
<b>OVERCURRENT PROTECTION</b>						
I <sub>OC_limit_HS</sub>	HS overcurrent protection	V <sub>CC</sub> < 28.5 V	3.5	4.25	5.5	A
I <sub>OC_limit_LS</sub>	LS overcurrent protection	V <sub>CC</sub> < 28.5 V	3.5	4.25	5.5	A
<b>THERMAL SHUTDOWN</b>						
T <sub>SDN</sub>	Junction temperature shutdown threshold		150	165	180	°C
T <sub>SDN_HYS</sub>	Junction temperature shutdown hysteresis		15	20	25	°C
T <sub>WARN</sub>	Junction temperature warning threshold		115	125	140	°C

**Figure 2. Switching Regulator Output vs Power Supply Voltage**

## 8 Detailed Description

### 8.1 Overview

The DRV10983-Q1 device is a three-phase sensorless motor driver with integrated power MOSFETs that provides drive-current capability up to 2 A continuously. The device is specifically designed for low-noise, low-external-component-count motor-drive applications. The device is configurable through a simple I<sup>2</sup>C interface to accommodate different motor parameters and spin-up profiles for different customer applications.

A 180° sensorless control scheme provides continuous sinusoidal output voltages to the motor phases to enable ultra-quiet motor operation by keeping the electrically induced torque ripple small.

The DRV10983-Q1 device features extensive protection and fault-detection mechanisms to ensure reliable operation. Voltage surge protection prevents the input V<sub>CC</sub> capacitor from overcharging, which is typical during motor deceleration. The device provides overcurrent protection without the need for an external current-sense resistor. Rotor-lock detection is available through several methods. These methods can be configured with register settings to ensure reliable operation. The device provides additional protection for undervoltage lockout (UVLO) and for thermal shutdown.

The commutation control algorithm continuously measures the motor phase current and periodically measures the V<sub>CC</sub> supply voltage. The device uses this information for BEMF estimation, and the information is also provided through the I<sup>2</sup>C register interface for debug and diagnostic use in the system, if desired.

A buck switching regulator efficiently steps down the supply voltage. The output of this regulator provides power for the internal circuits and can also be used to provide power for an external circuit such as a microcontroller. If providing power for an external circuit is not necessary (and to reduce system cost), configure the buck switching regulator as a linear regulator by replacing the inductor with a resistor.

The DRV10983-Q1 device has a flexible interface, capable of supporting both analog and digital inputs. In addition to the I<sup>2</sup>C interface, the device has FG, DIR, and SPEED pins. SPEED is the speed command input pin. DIR is the direction control input pin. FG is the speed indicator output, which shows the frequency of the motor commutation.

EEPROM is integrated in the DRV10983-Q1 device as memory for the motor parameter and operation settings. EEPROM data transfers to the registers after power-on and exit from sleep mode.

The DRV10983-Q1 device can also operate in register mode. If the system includes a microcontroller communicating through the I<sup>2</sup>C interface, the device can dynamically update the motor parameters and operation settings by writing to the registers. In this configuration, the EEPROM data is bypassed by the register settings.

## 8.3 Feature Description

### 8.3.1 Regulators

#### 8.3.1.1 Step-Down Regulator

The DRV10983-Q1 device includes a step-down hysteretic voltage regulator that can operate with either an external inductor or with an external resistor. The best efficiency is achieved when an external inductor (see [Figure 3](#)) is used. The regulator output voltage is 5 V. When the regulated voltage drops by the hysteresis level, the high-side FET turns on to raise the regulated voltage back to the target of 5 V. The switching frequency of the hysteretic regulator is not constant and changes with load.

If the step-down regulator is configured with an external inductor, it can deliver current to the load as specified by  $I_{REG\_MAX\_L}$ . If the step-down regulator is configured with an external resistor it, can deliver current to the load as specified by  $I_{REG\_MAX\_R}$ .

**Feature Description (continued)**

**Figure 3. Step-Down Regulator Configurations**
**8.3.1.2 3.3-V and 1.8-V LDO**

The DRV10983-Q1 device includes a 3.3-V LDO and a 1.8-V LDO. The 1.8-V LDO is for internal circuits only. The 3.3-V LDO is mainly for internal circuits, but can also drive external loads not to exceed  $I_{V3P3\_MAX}$ . For example, it can work as a pullup voltage for the FG, DIR, SDA, and SCL interface.

Both the V1P8 and V3P3 capacitors must be connected to GND.

**8.3.2 Protection Circuits**
**8.3.2.1 Thermal Shutdown**

The DRV10983-Q1 device has a built-in thermal shutdown function, which shuts down the device when the junction temperature is more than  $T_{SDN}$  °C and recovers operating conditions when the junction temperature falls to  $T_{SDN} - T_{SDN\_HYS}$  °C.

The OverTemp status bit (address 0x00, bit 15) is set during thermal shutdown. In addition to the thermal shutdown function there is a warning bit that is set whenever the device exceeds  $T_{WARN}$  and is indicated by the TempWarning bit of the FaultReg register (address 0x00, bit 14).

**8.3.2.2 UVLO**

The DRV10983-Q1 device has a built-in UVLO function block. The device is locked out when  $V_{CC}$  is below  $V_{UVLO\_F}$  and is unlocked when  $V_{CC}$  is above  $V_{UVLO\_R}$ . The hysteresis of the UVLO threshold is  $V_{UVLO\_HYS}$ . In addition to the main supply, the step-down regulator, charge pump, and 3.3-V LDO all have undervoltage lockout monitors.

**8.3.2.3 Current Protection**

The overcurrent shutdown function acts to protect the device if the current, as measured from the FETs, exceeds the  $I_{OC\_limit}$  threshold. It protects the device in the event of a short-circuit condition on the motor phases. This includes phase shorts to GND, phase shorts to phase, or phase shorts to  $V_{CC}$ . The DRV10983-Q1 device places the output drivers into a high-impedance state until the lock time  $t_{LOCK\_OFF}$  has expired. The OverCurr status bit of the FaultReg register (address 0x00, bit 11) is set.

The DRV10983-Q1 device also provides acceleration current-limit and lock-detection current-limit functions to protect the device and motor (see [Current Limit](#) and [Lock Detect and Fault Handling](#)).

## Feature Description (continued)

### 8.3.2.4 Lock

When the motor is blocked or stopped by an external force, lock protection is triggered, and the device stops driving the motor immediately. After the lock release time  $t_{LOCK\_OFF}$ , the DRV10983-Q1 device resumes driving the motor again. If the lock condition is still present, it enters the next lock protection cycle, and repeats until the lock condition is removed. With this lock protection, the motor and device do not overheat or become damaged due to the motor being locked (see [Lock Detect and Fault Handling](#)).

During a lock condition the Status register indicates which of the locks has occurred.

### 8.3.3 Motor Speed Control

The DRV10983-Q1 device offers four methods for indirectly controlling the speed of the motor by adjusting the output voltage amplitude. This can be accomplished by varying the supply voltage ( $V_{CC}$ ) or by controlling the speed command. The speed command can be controlled in one of three ways. The user can set the speed command by adjusting either the PWM input (PWM in) or the analog input (Analog) or by writing the speed command directly through the I<sup>2</sup>C serial port (I<sup>2</sup>C). The speed command is used to determine the PWM duty cycle output (PWM\_DCO) (see [Figure 5](#)).

The input PWM input (PWM in) can have a minimum duty cycle limit applied. DutyCycleLimit[1:0], accessible through the I<sup>2</sup>C interface, allows the user to configure the minimum duty cycle behavior. This behavior is illustrated in [Figure 4](#).

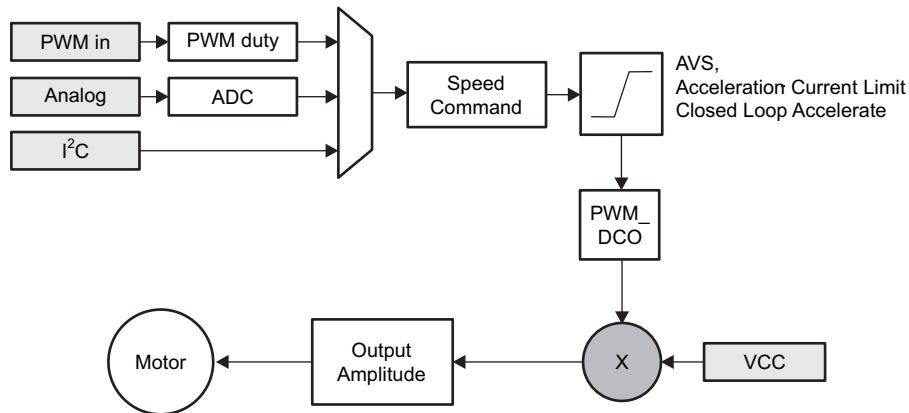

Figure 4. Duty Cycle Profile

The speed command may not always be equal to the PWM\_DCO because the DRV10983-Q1 device has the AVS function (see [Anti Voltage Supression Function](#)), the acceleration current-limit function (see [Acceleration Current Limit](#)), and the closed-loop accelerate function (see [Closed-Loop Accelerate](#)) to optimize the control performance. These functions can limit the PWM\_DCO, which affects the output amplitude (see [Figure 5](#)).

### Feature Description (continued)

**Figure 5. Multiplexing the Speed Command to the Output Amplitude Applied to the Motor**

The output voltage amplitude applied to the motor is developed through sine wave modulation so that the phase-to-phase voltage is sinusoidal.

When any phase is measured with respect to ground, the waveform is sinusoidally coupled with third-order harmonics. This encoding technique permits one phase to be held at ground while the other two phases are pulse-width modulated. [Figure 6](#) and [Figure 7](#) show the sinusoidal encoding technique used in the DRV10983-Q1 device.

**Figure 6. PWM Output and the Average Value**

Sinusoidal voltage from phase to phase

Sinusoidal voltage with third-order harmonics from phase to GND

**Figure 7. Representing Sinusoidal Voltages With Third-Order Harmonic Output**

The output amplitude is determined by the magnitude of  $V_{CC}$  and the PWM duty cycle output (PWM\_DCO). The PWM\_DCO represents the peak duty cycle that is applied in one electrical cycle. The maximum amplitude is reached when PWM\_DCO is at 100%. The peak output amplitude is  $V_{CC}$ . When the PWM\_DCO is at 50%, the peak amplitude is  $V_{CC} / 2$  (see [Figure 8](#)).

Feature Description (continued)

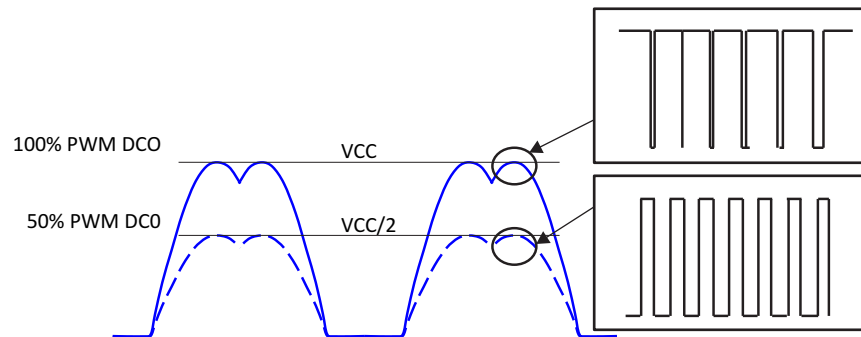

Figure 8. Output Voltage Amplitude Adjustment

Motor speed is controlled indirectly by controlling the output amplitude, which is achieved by either controlling  $V_{CC}$ , or controlling the PWM\_DCO. The DRV10983-Q1 device provides different options for the user to control the PWM\_DCO:

- Analog input (SPEED pin)
- PWM encoded digital input (SPEED pin)
- I<sup>2</sup>C serial interface.

See the [Closed Loop](#) section for more information.

8.3.4 Load Dump Handling

The recommended operation voltage of the DRV10983-Q1 device is from 6.2 V to 28 V. The device is able to drive the motor within this  $V_{CC}$  range.

In the load dump condition,  $V_{CC}$  can rise up to 45 V. Once the DRV10983-Q1 device detects that  $V_{CC}$  is higher than  $V_{OV\_R3}$ , it stops driving the motor and protects its own circuitry. When  $V_{CC}$  drops below  $V_{OV\_F}$ , the DRV10983-Q1 device continues to operate the motor based on the user’s command.

8.3.5 Sleep or Standby Condition

The DRV10983-Q1 device is available in either a sleep mode (DRV10983Q) or standby mode version (DRV10983SQ). The DRV10983-Q1 device enters either sleep or standby to conserve energy. When the device enters either sleep or standby, the device stops driving the motor. The switching regulator is disabled in the sleep mode version to conserve more energy. The I<sup>2</sup>C interface is disabled and any register data not stored in EEPROM is reset for the sleep mode version. The switching regulator remains active in the standby mode version. The register data is maintained, and the I<sup>2</sup>C interface remains active for standby mode version.

For different speed command modes, [Table 1](#) shows the timing and command to enter the sleep or standby condition.

Table 1. Conditions to Enter or Exit Sleep or Standby Condition

SPEED COMMAND MODE	ENTER SLEEP OR STANDBY CONDITION	EXIT FROM STANDBY CONDITION	EXIT FROM SLEEP CONDITION
Analog	SPEED pin voltage < $V_{EN\_SL\_SB}$ for $t_{EN\_SL\_SB}$	SPEED pin voltage > $V_{EX\_SB}$ for $t_{EX\_SB}$	SPEED pin high ( $V > V_{DIG\_IH}$ ) for $t_{EX\_SL\_SB}$
PWM	SPEED pin low ( $V < V_{DIG\_IL}$ ) for $t_{EN\_SL\_SB}$	SPEED pin high ( $V > V_{DIG\_IH}$ ) for $t_{EX\_SL\_SB}$	SPEED pin high ( $V > V_{DIG\_IH}$ ) for $t_{EX\_SL\_SB}$ <sup>(1)</sup>
I <sup>2</sup> C	SpdCtrl[8:0] is programmed as 0 for $t_{EN\_SL\_SB}$	SpdCtrl[8:0] is programmed as non-zero for $t_{EX\_SL\_SB}$	SPEED pin high ( $V > V_{DIG\_IH}$ ) for $t_{EX\_SL\_SB}$

(1) See [Table 2](#) for details on PWM duty cycle requirements to exit sleep mode.

Note that when using the analog speed command, a higher voltage is required to exit from the sleep condition than from the standby condition. The I<sup>2</sup>C speed command cannot take the device out of the sleep condition because I<sup>2</sup>C communication is disabled during the sleep condition.

**Table 2. Minimum PWM Duty Cycle Requirement for Different PWM Frequency to Exit Sleep Condition**

INPUT PWM FREQUENCY (kHz)	PWM DUTY CYCLE (%)
0.1 to 0.5	14
0.5 to 1	11
1 to 50	9
50 to 100	4
100	3.5

### 8.3.6 EEPROM Access

The DRV10983-Q1 device has 112 bits (7 registers with 16-bit width) of EEPROM data, which are used to program the motor parameters as described in the [I<sup>2</sup>C Serial Interface](#).

The procedure for programming the EEPROM is as follows. TI recommends to perform the EEPROM programming without the motor spinning, cycle the power after the EEPROM write, and read back the EEPROM to verify the programming is successful.

1. Power up with any voltage within operating voltage range (6.2 V to 28 V)
2. (DRV10983Q only) Exit from sleep condition
3. Wait 10 ms
4. Write register 0x60 to set MTR\_DIS = 1; this disables the motor driver.
5. Write register 0x31 with 0x0000 to clear the EEPROM access code
6. Write register 0x31 with 0xC0DE to enable access to EEPROM
7. Read register 0x32 for eeReadyStatus = 1
8. Case-A: Mass Write
  - (a) Write all individual shadow registers
    - (a) Write register 0x90 (CONFIG1) with CONFIG1 data
    - (b) ...
    - (c) Write register 0x96 (CONFIG7) with CONFIG7 data
  - (b) Write the following to register 0x35
    - (a) ShadowRegEn = 0
    - (b) eeRefresh = 0
    - (c) eeWRnEn = 1
    - (d) EEPROM Access Mode = 10
  - (c) Wait for register 0x32 eeReadyStatus = 1 – EEPROM is now updated with the contents of the shadow registers.
9. Case-B: Mass Read
  - (a) Write the following to register 0x35
    - (a) ShadowRegEn = 0
    - (b) eeRefresh = 0
    - (c) eeWRnEn = 0
    - (d) eeAccMode = 10
  - (b) Internally, the device starts reading the EEPROM and storing it in the shadow registers.
  - (c) Wait for register 0x32 eeReadyStatus = 1 – shadow registers now contain the EEPROM values
10. Write register 0x60 to set MTR\_DIS = 0; this re-enables the motor driver

## 8.4 Device Functional Modes

This section includes the logic required to be able to reliably start and drive the motor. It describes the processes used in the logic core and provides the information needed to configure the parameters effectively to work over a wide range of applications.

### 8.4.1 Motor Parameters

See the [DRV10983-Q1 Tuning Guide](#) for the motor parameter measurement.

The motor resistance and motor velocity constants are two important parameters used to characterize a BLDC motor. The DRV10983-Q1 device requires these parameters to be configured in the register. The motor resistance is programmed by writing the values for  $Rm[6:0]$  (combination of  $RMShift[2:0]$  and  $RMValue[3:0]$ ) in the Config1 register. The motor velocity constant is programmed by writing the values for  $Kt[6:0]$  (combination of  $KTShift[2:0]$  and  $KTValue[3:0]$ ) in the Config2 register.

#### 8.4.1.1 Motor Resistance

For a wye-connected motor, the motor phase resistance refers to the resistance from the phase output to the center tap,  $R_{PH\_CT}$  (denoted as  $R_{PH\_CT}$  in [Figure 9](#)).

**Figure 9. Wye-Connected Motor Resistance**

For a delta-connected motor, the motor phase resistance refers to the equivalent phase to center tap in the wye configuration. In [Figure 10](#), it is denoted as  $R_Y$ .  $R_{PH\_CT} = R_Y$ .

For both the delta-connected motor and the wye-connected motor, the easy way to get the equivalent  $R_{PH\_CT}$  is to measure the resistance between two phase terminals ( $R_{PH\_PH}$ ), and then divide this value by two,  $R_{PH\_CT} = \frac{1}{2} R_{PH\_PH}$ .

**Figure 10. Delta-Connected Motor and the Equivalent Wye Connections**

**Device Functional Modes (continued)**

The motor resistance ( $R_{PH\_CT}$ ) must be converted to a 7-bit digital register value  $Rm[6:0]$  to program the motor resistance value. The digital register value can be determined as follows:

1. Convert the motor resistance ( $R_{PH\_CT}$ ) to a digital value where the LSB is weighted to represent 9.67 m $\Omega$ :  
 $Rmdig = R_{PH\_CT} / 0.00967$ .
2. Encode the digital value such that  $Rmdig = RMValue[3:0] \ll RMsift[2:0]$ .

The maximum resistor value,  $R_{PH\_CT}$ , that can be programmed for the DRV10983-Q1 device is 18.5  $\Omega$ , which represents  $Rmdig = 1920$  and an encoded  $Rm[6:0]$  value of 0x7Fh. The minimum resistor the DRV10983-Q1 device supports is 0.029  $\Omega$ ,  $R_{PH\_CT}$ , which represents  $Rmdig = 3$ .

For convenience, the encoded value for  $Rm[6:0]$  can also be obtained from [Table 3](#).

**Table 3. Motor Resistance Look-Up Table**

RM[6:0] {RMsift[2:0], RMValue[3:0]}		$R_{PH\_CT}$ ( $\Omega$ )	RM[6:0] {RMsift[2:0], RMValue[3:0]}		$R_{PH\_CT}$ ( $\Omega$ )	RM[6:0] {RMsift[2:0], RMValue[3:0]}		$R_{PH\_CT}$ ( $\Omega$ )

### 8.4.1.2 Motor Velocity Constant

The motor velocity constant,  $K_t[6:0]$  describes the phase-to-phase BEMF voltage of the motor as a function of the motor velocity.

Figure 11 shows the measurement technique for this constant as used in the DRV10983-Q1 device.

Figure 11.  $K_{tPH}$  Definition

With the motor coasting, use an oscilloscope to capture the differential voltage waveform between any two phases. Derive the motor velocity constant used by the DRV10983-Q1 device as shown in Equation 1.

$$K_{tPH} = E_p \times t_e$$

where

- $E_p$  is  $\frac{1}{2}$  the peak-to-peak amplitude of the measured voltage
  - $t_e$  is the electrical period
- (1)

The measured motor velocity constant ( $K_{tPH}$ ) must be converted to a 7-bit digital register value  $K_t[6:0]$  (combination of  $K_t\text{Shift}[2:0]$  and  $K_t\text{Value}[3:0]$ ) to program the motor velocity constant value. The digital register value can be determined as follows:

1. Convert the measured  $K_{tPH}$  to a weighted digital value:  $K_{t_{ph\_dig}} = 1090 \times K_{tPH}$
2. Encode the digital value such that  $K_{t_{ph\_dig}} = K_t\text{Value}[3:0] \ll K_t\text{Shift}[2:0]$ .

The maximum  $K_{tPH}$  that can be programmed is 1760 mV/Hz. This represents a digital value of 1920 and an encoded  $K_t[6:0]$  value of 0x7Fh. The minimum  $K_{tPH}$  that can be programmed is 0.92 mV/Hz, which represents a digital value of 1 and an encoded  $K_t[6:0]$  value of 0x01h.

For convenience, the encoded value of  $K_t[6:0]$  may also be obtained from Table 4.

**Table 4. Motor Velocity Constant Look-Up Table**

Kt[6:0] {KtShift[2:0], KtValue[3:0]}		Kt <sub>PH</sub> (mV/Hz)	Kt [6:0] {KtShift[2:0], KtValue[3:0]}		Kt <sub>PH</sub> (mV/Hz)	Kt [6:0] {KtShift[2:0], KtValue[3:0]}		Kt <sub>PH</sub> (mV/Hz)

## 8.4.2 Starting the Motor Under Different Initial Conditions

The motor can be in one of three states when the DRV10983-Q1 device attempts to begin the start-up process. The motor may be stationary, or spinning in the forward or reverse directions. The DRV10983-Q1 device includes a number of features to allow for reliable motor start under all of these conditions. [Figure 12](#) shows the motor start-up flow for each of the three initial motor states.

### 8.4.2.1 Case 1 – Motor is Stationary

If the motor is stationary, the commutation logic must be initialized to be in phase with the position of the motor. The DRV10983-Q1 device provides for two options to initialize the commutation logic to the motor position. Initial position detect (IPD) determines the position of the motor based on the deterministic inductance variation, which is often present in BLDC motors. The *align-and-go* technique forces the motor into alignment by applying a voltage across a particular motor phase to force the motor to rotate in alignment with this phase.

### 8.4.2.2 Case 2 – Motor is Spinning in the Forward Direction

If the motor is spinning forward with enough velocity, the DRV10983-Q1 device may be configured to go directly into closed loop. By resynchronizing to the spinning motor, the user achieves the fastest possible start-up time for this initial condition.

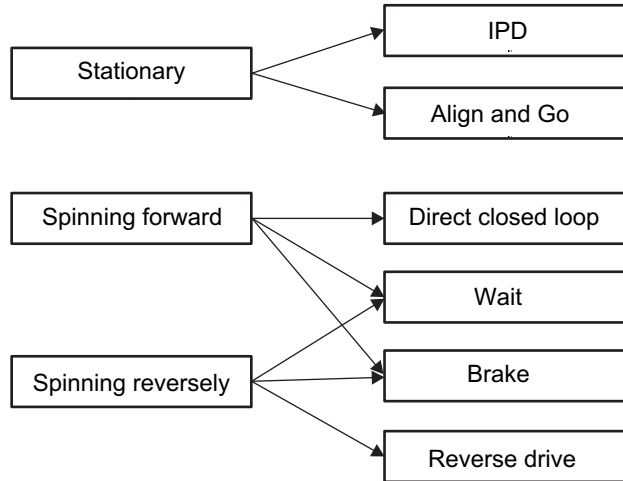

### 8.4.2.3 Case 3 – Motor is Spinning in the Reverse Direction

If the motor is spinning in the reverse direction, the DRV10983-Q1 device provides several methods to convert it back to the forward direction.

One method, reverse drive, allows the motor to be driven so that it accelerates through zero velocity. The motor achieves the shortest possible spin-up time in systems where the motor is spinning in the reverse direction.

If this feature is not selected, then the DRV10983-Q1 device may be configured either to wait for the motor to stop spinning or to brake the motor. After the motor has stopped spinning, the motor start-up sequence proceeds as it would for a motor which is stationary.

Take care when using the reverse-drive or brake feature to ensure that the current is limited to an acceptable level and that the supply voltage does not surge as a result of energy being returned to the power supply.

**Figure 12. Start the Motor Under Different Initial Conditions**

### 8.4.3 Motor Start Sequence

Figure 13 shows the motor-start sequence implemented in the DRV10983-Q1 device.

Figure 13. Motor Starting-Up Flow

**Power-On State** This is the initial power-on state of the motor start sequencer (MSS). The MSS starts in this state on initial power-up or whenever the DRV10983-Q1 device comes out of either standby or sleep mode.

**ISDen Judgment** After power-on, the DRV10983-Q1 MSS enters the ISDen judgment where it checks to see if the initial speed detect (ISD) function is enabled (ISDen = 1). If ISD is disabled, the MSS proceeds directly to the BrkEn Judgment. If ISD is enabled, the motor start sequence advances to the ISD state.

**ISD State** The MSS determines the initial condition of the motor (see [Initial Speed Detect](#)).

**Speed<ISDThr Judgment** If the motor speed is lower than the threshold defined by ISDThr[1:0], then the motor is considered to be stationary and the MSS proceeds to the BrkEn judgment. If the speed is greater than the threshold defined by ISDThr[1:0], the start sequence proceeds to the Forward judgment.

**Forward Judgment** The MSS determines whether the motor is spinning in the forward or the reverse direction. If the motor is spinning in the forward direction, the DRV10983-Q1 device executes the resynchronization (see [Motor Resynchronization](#)) process by transitioning directly into the ClosedLoop state. If the motor is spinning in the reverse direction, the MSS proceeds to the

Speed>RvsDrThr.

**Speed>RvsDrThr Judgment** The motor start sequencer checks to see if the reverse speed is greater than the threshold defined by RvsDrThr[1:0]. If it is, then the MSS returns to the ISD state to allow the motor to decelerate. This prevents the DRV10983-Q1 device from attempting to reverse drive or brake a motor that is spinning too quickly. If the reverse speed of the motor is less than the threshold defined by RvsDrThr[1:0], then the MSS advances to the RvsDrEn judgment.

**RvsDrEn Judgment** The MSS checks to see if the reverse drive function is enabled (RvsDrEn = 1). If it is, the MSS transitions into the RvsDr state. If the reverse drive function is not enabled, the MSS advances to the BrkEn judgment.

**RvsDr State** The DRV10983-Q1 device drives the motor in the forward direction to force it to rapidly decelerate (see [Reverse Drive](#)). When it reaches zero velocity, the MSS transitions to the Accelerate state.

**BrkEn Judgment** The MSS checks to determine whether the brake function is enabled (BrkDoneThr[2:0] ≠ 000). If the brake function is enabled, the MSS advances to the brake state.

**Brake State** The device performs the brake function (see [Motor Brake](#)).

**Time>BrkDoneThr Judgment** The MSS applies brake for a time configured by BRKDoneThr[2:0]. After brake state, the MSS advances to the IPDEn judgment.

**IPDEn Judgment** The MSS checks to see if IPD has been enabled (IPDCurrThr[3:0] ≠ 0000). If the IPD is enabled, the MSS transitions to the IPD state. Otherwise, it transitions to the align state.

**Align State** The DRV10983-Q1 device performs the align function (see [Align](#)). After the align completes, the MSS transitions to the Accelerate state.

**IPD State** The DRV10983-Q1 device performs the IPD function. The IPD function is described in [IPD](#). After the IPD completes, the MSS transitions to the accelerate state.

**Accelerate State** The DRV10983-Q1 device accelerates the motor according to the settings of StAccel and StAccel2. After applying the accelerate settings, the MSS advances to the Speed>Op2CIsThr judgment.

**Speed>Op2CIsThr Judgment** The motor accelerates until the drive rate exceeds the threshold configured by the Op2CIsThr[4:0] settings. When this threshold is reached, the DRV10983-Q1 device enters into the ClosedLoop state.

**ClosedLoop State** In this state, the DRV10983-Q1 device drives the motor based on feedback from the commutation control algorithm.

**DIR Pin Change Judgment** If the DIR pin is changed during any of above states, DRV10983-Q1 device stops driving the motor and restarts from the beginning.

#### 8.4.3.1 Initial Speed Detect

The ISD function is used to identify the initial condition of the motor. If the function is disabled, the DRV10983-Q1 device does not perform the initial speed detect function and treats the motor as if it is stationary.

Phase-to-phase comparators are used to detect the zero crossings of the motor's BEMF voltage while it is coasting (motor phase outputs are in the high-impedance state). [Figure 14](#) shows the configuration of the comparators.

**Figure 14. Initial Speed Detect Function**

If the UW comparator output is lagging the UV comparator by 60°, the motor is spinning forward. If the UW comparator output is leading the UV comparator by 60°, the motor is spinning in reverse.

The motor speed is determined by measuring the time between two rising edges of either of the comparators.

If neither of the comparator outputs toggles for a given amount of time, the condition is defined as stationary. The amount of time can be programmed by setting the register bits `ISDThr[1:0]`.

#### 8.4.3.2 Motor Resynchronization

The resynchronize function works when the ISD function is enabled and determines that the initial state of the motor is spinning in the forward direction. The speed and position information measured during ISD are used to initialize the drive state of the DRV10983-Q1 device, which can transition directly into the closed-loop running state without needing to stop the motor.

#### 8.4.3.3 Reverse Drive

The ISD function measures the initial speed and the initial position; the DRV10983-Q1 reverse drive function acts to reverse accelerate the motor through zero speed and to continue accelerating until the closed loop threshold is reached (see Figure 15). If the reverse speed is greater than the threshold configured in `RvsDrThr[1:0]`, then the DRV10983-Q1 device waits until the motor coasts to a speed that is less than the threshold before driving the motor to reverse accelerate.

**Figure 15. Reverse Drive Function**

Reverse drive is suitable for applications where the load condition is light at low speed and relatively constant and where the reverse speed is low (that is, a fan motor with little friction). For other load conditions, the motor brake function provides a method for helping force a motor which is spinning in the reverse direction to stop spinning before a normal start-up sequence.

#### 8.4.3.4 Motor Brake

The motor brake function can be used to stop the spinning motor before attempting to start the motor. The brake is applied by turning on all three of the low-side driver FETs.

Brake is enabled by configuring a non-zero BrkDoneThr[2:0]. Brake is applied for a time configured by BrkDoneThr[2:0] (forward or reverse). After the motor is stopped, the motor position is unknown. To proceed with restarting in the correct direction, the IPD or align-and-go algorithm must be implemented. The motor start sequence is the same as it would be for a motor starting in the stationary condition.

The motor brake function can be disabled. The motor skips the brake state and attempts to spin the motor as if it were stationary. If this happens while the motor is spinning in either direction, the start-up sequence may not be successful.

#### 8.4.3.5 Motor Initialization

##### 8.4.3.5.1 Align

The DRV10983-Q1 device aligns a motor by injecting dc current through a particular phase pattern which is current flowing into phase V, flowing out from phase W for a certain time (configured by AlignTime[2:0]). The current magnitude is determined by OpenLCurr[1:0]. The motor should be aligned at the known position.

The time of align affects the start-up timing (see [Start-Up Timing](#)). A bigger-inertia motor requires longer align time.

##### 8.4.3.5.2 IPD

The inductive sense method is used to determine the initial position of the motor when IPD is enabled. IPD is enabled by selecting IPDCurrThr[3:0] to any value other than 0000.

IPD can be used in applications where reverse rotation of the motor is unacceptable. Because IPD is not required to wait for the motor to align with the commutation, it can allow for a faster motor start sequence. IPD works well when the inductance of the motor varies as a function of position. Because it works by pulsing current to the motor, it can generate acoustics which must be taken into account when determining the best start method for a particular application.

##### 8.4.3.5.2.1 IPD Operation

The IPD operates by sequentially applying voltage across two of the three motor phases according to the following sequence: VW WV UV VU WU UW (see [Figure 16](#)). When the current reaches the threshold configured in IPDCurrThr[3:0], the voltage across the motor is stopped. The DRV10983-Q1 device measures the time it takes from when the voltage is applied until the current threshold is reached. The time varies as a function of the inductance in the motor windings. The state with the shortest time represents the state with the minimum inductance. The minimum inductance is because of the alignment of the north pole of the motor with this particular driving state.

Permanent Magnet ← Saturation Position of the Magnetic Field ← Smallest Inductance ← Minimum Time

Figure 16. IPD Function

8.4.3.5.2.2 IPD Release Mode

Two options are available for stopping the voltage applied to the motor when the current threshold is reached. If IPDRIsMd = 0, the recirculate mode is selected. The low-side (S6) MOSFET remains on to allow the current to recirculate between the MOSFET (S6) and body diode (S2) (see Figure 17). If IPDRIsMd = 1, the tri-state mode is selected. Both the high-side (S1) and low-side (S6) MOSFETs are turned off and the current flies back across the body diodes into the power supply (see Figure 18).

In the high-impedance state, the phase current has a faster settle-down time, but that could result in a surge on V<sub>CC</sub>. Manage this with appropriate selection of either a clamp circuit or by providing sufficient capacitance between V<sub>CC</sub> and GND. If the voltage surge cannot be contained and if it is unacceptable for the application, then select the recirculate mode. When selecting the recirculate mode, select the IPDClk[1:0] bits to give the current in the motor windings enough time to decay to 0.

Figure 17. IPD Release Mode 0

Figure 18. IPD Release Mode 1

#### 8.4.3.5.2.3 IPD Advance Angle

After the initial position is detected, the DRV10983-Q1 device begins driving the motor at an angle specified by IPDAdvCgl[1:0].

Advancing the drive angle anywhere from 0° to 180° results in positive torque. Advancing the drive angle by 90° results in maximum initial torque. Applying maximum initial torque could result in uneven acceleration to the rotor. Select the IPDAdvCgl[1:0] to allow for smooth acceleration in the application (see Figure 19).

Figure 19. IPD Advance Angle

#### 8.4.3.5.3 Motor Start

After it is determined that the motor is stationary and after completing the motor initialization with either align or IPD, the DRV10983-Q1 device begins to accelerate the motor. This acceleration is accomplished by applying a voltage determined by the open-loop current setting (OpenLCurr[1:0]) to the appropriate drive state and by increasing the rate of commutation without regard to the real position of the motor (referred to as open-loop operation). The function of the open-loop operation is to drive the motor to a minimum speed so that the motor generates sufficient BEMF to allow the commutation control logic to accurately drive the motor.

Table 5 lists the configuration options that can be set in register to optimize the initial motor acceleration stage for different applications.

**Table 5. Configuration Options for Controlling Open-Loop Motor Start**

DESCRIPTION	REG. NAME	CONFIGURATION BITS	MIN. VALUE	MAX. VALUE
Open- to closed-loop threshold	CONFIG4	Op2ClsThr[4:0]	0.8 Hz	204.8 Hz
Align time	CONFIG4	AlignTime[2:0]	40 ms	5.3 s
First-order accelerate	CONFIG4	StAccel[2:0]	0.019 Hz/s	76 Hz/s
Second-order accelerate	CONFIG4	StAccel2[2:0]	0.0026 Hz/s <sup>2</sup>	57 Hz/s <sup>2</sup>
Open-loop current setting	CONFIG3	OpenLCurr[1:0]	200 mA	1.6 A
Align current setting			150 mA	1.2 A
Open-loop current ramping	CONFIG3	OpLCurrRt[2:0]	0.023 V <sub>CC</sub> /s	6 V <sub>CC</sub> /s

### 8.4.3.6 Start-Up Timing

Start-up timing is determined by the align and accelerate time. The align time can be set by AlignTime[2:0]. The accelerate time is defined by the open-to-closed loop threshold Op2ClsThr[4:0] along with the first-order StAccel[2:0](A1) and second-order StAccel2[2:0](A2) accelerate rates. Figure 20 shows the motor start-up process.

**Figure 20. Motor Start-Up Process**

Select the first-order and second-order accelerate rates to allow the motor to reliably accelerate from zero velocity up to the closed-loop threshold in the shortest time possible. Using a slow accelerate rate during the first order accelerate stage can help improve reliability in applications where it is difficult to accurately initialize the motor with either align or IPD.

Select the open-to-closed loop threshold to allow the motor to accelerate to a speed that generates sufficient BEMF for closed-loop control. This is determined by the velocity constant of the motor based on the relationship described in Equation 2.

$$\text{BEMF} = K_{tPH} \times \text{speed (Hz)} \quad (2)$$

### 8.4.4 Align Current

During the align state, the measured align current is dependent on actual motor resistance and  $r_{DS(on)}$  of the internal FETs. The relationship between measured align current and configured align current is derived from actual motor resistance, configured motor resistance and  $r_{DS(on)}$ .

$$\text{AlignCurrent\_Measured} = \text{AlignCurrent\_Configured} \times \left[ \frac{R_m}{R_{\text{motor}} + r_{DS(on)}} \right]$$

where

- AlignCurrent\_Measured is the actual align current measured during the align state
- AlignCurrent\_Configured is the align current configured by OpenLCurr[1:0]
- $R_{\text{motor}}$  is the actual motor resistance
- $r_{DS(on)}$  is the resistance between the drain and source of the FETs during the on-state
- $R_m$  is configured by Rm[6:0]

(3)

### 8.4.5 Start-Up Current Setting

The start-up current setting is to control the peak start-up during open loop. During open-loop operation, it is desirable to control the magnitude of drive current applied to the motor. This is helpful in controlling and optimizing the rate of acceleration. The limit takes effect during reverse drive, align, and acceleration.

The start current is set by programming the OpenLCurr[1:0] bits. The current should be selected to allow the motor to reliably accelerate to the handoff threshold. Heavier loads may require a higher current setting, but it should be noted that the rate of acceleration is limited by the acceleration rate (StAccel[2:0], StAccel2[2:0]). If the motor is started with more current than necessary to reliably reach the handoff threshold, it results in higher power consumption.

The start current is controlled based on the relationship shown in Equation 4 and Figure 21. The duty cycle applied to the motor is derived from the calculated value for  $U_{Limit}$  and the magnitude of the supply voltage,  $V_{CC}$ , as well as the drive state of the motor.

$$U_{Limit} = I_{Limit} \times R_m + \text{Speed (Hz)} \times K_t$$

where

- $I_{Limit}$  is configured by OpenLCurr[1:0]
- $R_m$  is configured by Rm[6:0]
- Speed is variable based motor's open loop acceleration profile
- $K_t$  is configured by Kt[6:0]

(4)

Figure 21. Motor Start-Up Current

#### 8.4.5.1 Start-Up Current Ramp-Up

A fast change in the applied drive current may result in a sudden change in the driving torque. In some applications, this could result in acoustic noise. To avoid this, the DRV10983-Q1 device allows the option of limiting the rate at which the current is applied to the motor. OpLCurrRt[2:0] sets the maximum voltage ramp-up rate that is applied to the motor. The waveforms in Figure 22 show how this feature can be used to gradually ramp the current applied to the motor.

Figure 22. Motor Start-Up Current Ramp

### 8.4.6 Closed Loop

In closed loop operation, the DRV10983-Q1 device continuously samples the current in the U phase of the motor and uses this information to estimate the BEMF voltage that is present. The drive state of the motor is controlled based on the estimated BEMF voltage.

### 8.4.6.1 Half-Cycle Control and Full-Cycle Control

The estimated BEMF used to control the drive state of the motor has two zero-crosses every electrical cycle. The DRV10983-Q1 device can be configured to update the drive state either once every electrical cycle or twice for every electrical cycle. When AdjMode is programmed to 1, half-cycle adjustment is applied. The control logic is triggered at both the rising edge and falling edge. When AdjMode is programmed to 0, full-cycle adjustment is applied. The control logic is triggered only at the rising edge (see Figure 23).

Half-cycle adjustment provides a faster response when compared with full-cycle adjustment. Use half-cycle adjustment whenever the application requires operation over large dynamic loading conditions. Use the full-cycle adjustment for low-current (<1 A) applications because it offers more tolerance for current-measurement offset errors.

Figure 23. Closed-Loop Control Commutation-Adjustment Mode

### 8.4.6.2 Analog-Mode Speed Control

The SPEED input pin can be configured to operate as an analog input (SpdCtrlMd = 0).

When configured for analog mode, the voltage range on the SPEED pin can be varied from 0 to V3P3. If  $SPEED > V_{ANA\_FS}$ , the speed command is maximum. If  $V_{ANA\_ZS} \leq SPEED < V_{ANA\_FS}$  the speed command changes linearly according to the magnitude of the voltage applied at the SPEED pin. If  $SPEED < V_{ANA\_ZS}$  the speed command is to stop the motor. Figure 24 shows the speed command when operating in analog mode.

Figure 24. Analog-Mode Speed Command

### 8.4.6.3 Digital PWM-Input-Mode Speed Control

If SpdCtrlMd = 1, the SPEED input pin is configured to operate as a PWM-encoded digital input. The PWM duty cycle applied to the SPEED pin can be varied from 0 to 100%. The speed command is proportional to the PWM input duty cycle. The speed command stops the motor when the PWM input keeps at 0 for  $t_{EN\_SL\_SB}$  (see Figure 25).

The frequency of the PWM input signal applied to the SPEED pin is defined as  $f_{PWM}$ . This is the frequency the device can accept to control motor speed. It does not correspond to the PWM output frequency that is applied to the motor phase. The PWM output frequency can be configured to be either 25 kHz when the PWMFreq bit is set to 0 or to 50 kHz when PWMFreq bit is set to 1.

Figure 25. PWM-Mode Speed Command

#### 8.4.6.4 I<sup>2</sup>C-Mode Speed Control

The DRV10983-Q1 device can also command the speed through the I<sup>2</sup>C serial interface. To enable this feature, the OverRide bit is set to 1. When the DRV10983-Q1 device is configured to operate in I<sup>2</sup>C mode, it ignores the signal applied to the SPEED pin.

The speed command can be set by writing the SpdCtrl[8:0] bits. The 9-bit SpdCtrl [8:0] located in the SpeedCtrl registers is used to set the peak amplitude voltage applied to the motor. The maximum speed command is set when SpdCtrl [8:0] is set to 0x1FF (511).

#### 8.4.6.5 Closed-Loop Accelerate

To prevent sudden changes in the torque applied to the motor which could result in acoustic noise, the DRV10983-Q1 device provides the option of limiting the maximum rate at which the speed command changes. CIsLpAccel[2:0] can be programmed to set the maximum rate at which the speed command changes (shown in Figure 26).

Figure 26. Closed Loop Accelerate

#### 8.4.6.6 Control Coefficient

The DRV10983-Q1 device continuously measures the motor current and uses this information to control the drive state of the motor when operating in closed-loop mode. In applications where noise makes it difficult to control the commutation optimally, the CtrlCoef[1:0] can be used to attenuate the feedback used for closed-loop control. The loop is less reactive to the noise on the feedback and provides for a smoother output.

#### 8.4.6.7 Commutation Control Advance Angle

To achieve the best efficiency, it is often desirable to control the drive state of the motor so that the motor phase current is aligned with the motor BEMF voltage.

To align the motor phase current with the motor BEMF voltage, consider the inductive effect of the motor. The voltage applied to the motor should be applied in advance of the motor BEMF voltage (see Figure 27). The DRV10983-Q1 device provides configuration bits for controlling the time ( $t_{adv}$ ) between the driving voltage and BEMF.

For motors with salient pole structures, aligning the motor BEMF voltage with the motor current may not achieve the best efficiency. In these applications, the timing advance should be adjusted accordingly. Accomplish this by operating the system at constant speed and load conditions and by adjusting  $t_{adv}$  until the minimum current is achieved.

**Figure 27. Advance Time ( $t_{adv}$ ) Definition**

The DRV10983-Q1 device has two options for adjusting the motor commutate advance time. When  $CommAdvMode = 0$ , mode 0 is selected. When  $CommAdvMode = 1$ , mode 1 is selected.

Mode 0:  $t_{adv}$  is maintained to be a fixed time relative to the estimated BEMF zero cross as determined by Equation 5.

$$t_{adv} = t_{SETTING} \quad (5)$$

Mode 1:  $t_{adv}$  is maintained to be a variable time relative to the estimated BEMF zero cross as determined by Equation 6.

$$t_{adv} = t_{SETTING} \times (U - BEMF) / U.$$

where

- U is the phase voltage amplitude
- BEMF is phase BEMF amplitude

$t_{SETTING}$  (in  $\mu s$ ) is determined by the configuration of the TCtrlAdvShift [2:0] and TCtrlAdvValue [3:0] bits as defined in Equation 7. For convenience, the available  $t_{SETTING}$  values are provided in Table 6.

$$t_{SETTING} = 2.5 \mu s \times [TCtrlAdvValue[3:0]] \ll TCtrlAdvShift[2:0] \quad (7)$$

**Table 6. Configuring Commutation Advance Timing by Adjusting  $t_{\text{SETTING}}$** 

TCtrlAdv [6:0] {TCtrlAdvShift[2:0], TCtrlAdvValue[3:0]}		$t_{\text{SETTING}}$ ( $\mu\text{s}$ )	TCtrlAdv [6:0] {TCtrlAdvShift[2:0], TCtrlAdvValue[3:0]}		$t_{\text{SETTING}}$ ( $\mu\text{s}$ )	TCtrlAdv [6:0] {TCtrlAdvShift[2:0], TCtrlAdvValue[3:0]}		$t_{\text{SETTING}}$ ( $\mu\text{s}$ )

### 8.4.7 Current Limit

The DRV10983-Q1 device has several current-limit modes to help ensure optimal control of the motor and to ensure safe operation. The various current-limit modes are listed in [Table 7](#). Acceleration current limit is used to provide a means of controlling the amount of current delivered to the motor. This is useful when the system needs to limit the amount of current pulled from the power supply during motor start-up. The lock-detection current limit is a configurable threshold that can be used to limit the current applied to the motor. Overcurrent protection is used to protect the device; therefore, it cannot be disabled or configured to a different threshold. The current-limit modes are described in the following sections.

**Table 7. DRV10983-Q1 Current-Limit Modes**

CURRENT LIMIT MODE	SITUATION	ACTION	FAULT DIAGNOSIS
Acceleration current limit	Motor start	Limit the output voltage amplitude	No fault
Lock-detection current limit	Motor locked	Stop driving the motor and enter the lock state	Mechanical rotation error
Overcurrent shutdown	Short circuit	Stop driving the motor and enter the lock state	Circuit connection

#### 8.4.7.1 Acceleration Current Limit

The acceleration current limit limits the voltage applied to the motor to prevent the current from exceeding the programmed threshold. The acceleration current limit threshold is configured by writing the SWiLimitThr[3:0] bits to select  $I_{\text{LIMIT}}$ . The acceleration current limit does not use a direct measurement of current. It uses the programmed motor resistance,  $R_m$ , and programmed motor velocity constant,  $K_t$ , to limit the voltage applied to the motor,  $U$ , as shown in [Figure 28](#) and [Equation 8](#).

When the acceleration current limit is active, it does not stop the motor from spinning nor does it trigger a fault. The functionality of the acceleration current limit is only available in closed-loop control.

Figure 28. Acceleration Current Limit

$$U_{LIMIT} = I_{LIMIT} \times R_m + \text{Speed} \times K_t \tag{8}$$

### 8.4.8 Lock Detect and Fault Handling

The DRV10983-Q1 device provides several options for determining if the motor becomes locked as a result of some external torque. Five lock-detect schemes work together to ensure the lock condition is detected quickly and reliably. Figure 29 shows the logic which integrates the various lock-detect schemes. When a lock condition is detected, the DRV10983-Q1 device takes action to prevent continuously driving the motor in order to prevent damage to the system or the motor.

In addition to detecting if there is a locked motor condition, the DRV10983-Q1 device also identifies and takes action if there is no motor connected to the system.

Each of the five lock-detect schemes and the no-motor detection can be disabled by respective register bits LockEn[5:0].

When a lock condition is detected, the FaultReg register provides an indication of which of the six different conditions was detected on Lock5 to Lock0. These bits are reset when the motor restarts. The bits in the FaultReg register are set even if the lock detect scheme is disabled.

The DRV10983-Q1 device reacts to either locked-rotor or no-motor-connected conditions by putting the output drivers into a high-impedance state. To prevent the energy in the motor from pumping the supply voltage, the DRV10983-Q1 device incorporates an anti-voltage-surge (AVS) process whenever the output stages transition into the high-impedance state. The AVS function is described in *Anti Voltage Supression Function*. After entering the high-impedance state as a result of a fault condition, the system tries to restart after  $t_{LOCK\_OFF}$ .

Figure 29. Lock Detect and Fault Diagnose

### 8.4.8.1 Lock0: Lock-Detection Current Limit Triggered

The lock-detection current-limit function provides a configurable threshold for limiting the current to prevent damage to the system. This is often tripped in the event of a sudden locked-rotor condition. The DRV10983-Q1 device continuously monitors the current in the low-side drivers as shown in [Figure 30](#). If the current goes higher than the threshold configured by the HWiLimitThr[2:0] bits, then the DRV10983-Q1 device stops driving the motor by placing the output phases into a high-impedance state. The Lock0 bit is set and a lock condition is reported. It retries after  $t_{LOCK\_OFF}$ .

Set the lock-detection current limit to a higher value than the acceleration current limit.

Figure 30. Lock-Detection Current Limit

### 8.4.8.2 Lock1: Abnormal Speed

If the motor is operating normally, the motor BEMF should always be less than the output amplitude. The DRV10983-Q1 device uses two methods of monitoring the BEMF in the system. The U phase current is monitored to maintain an estimate of BEMF based on the setting for Rm[6:0] {RmShift[2:0],RmValue[3:0]}. In addition, the BEMF is estimated based on the operation speed of the motor and the setting for Kt[6:0] {KtShift[2:0],KtValue[3:0]}. [Figure 31](#) shows the method for using this information to detect a lock condition. If the motor BEMF is much higher than the output amplitude for a certain period of time,  $t_{LCK\_ETR}$ , it means the estimated speed is wrong, and the motor has gotten out of phase.

Figure 31. Lock Detection 1

### 8.4.8.3 Lock2: Abnormal Kt

For any given motor, the integrated value of BEMF during half of an electrical cycle is constant. The value is determined by the motor velocity constant ( $Kt_{PH}$ ) (see [Figure 32](#)). The motor velocity constant is the same regardless of whether the motor is running fast or slow. This constant value is continuously monitored by calculation and used as a criterion to determine the motor lock condition, and is referred to as Ktc.

Based on the  $Kt_{PH}$  value programmed, create a range from Kt\_low to Kt\_high. If Ktc goes beyond the range for a certain period of time,  $t_{LCK\_ETR}$ , lock is detected. Kt\_low and Kt\_high are determined by KtLckThr[1:0] (see [Figure 33](#)).

Figure 32. BEMF Integration

Figure 33. Abnormal-Kt Lock Detect

**8.4.8.4 Lock3 (Fault3): No-Motor Fault**

The phase U current is checked after transitioning from open loop to closed loop. If phase U current is not greater than 140 mA then the motor is not connected as shown in Figure 34. This condition is treated and reported as a fault.

Figure 34. No Motor Error

**8.4.8.5 Lock4: Open-Loop Motor-Stuck Lock**

Lock4 is used to detect locked-motor conditions while the motor start sequence is in open loop.

For a successful startup, motor speed should be equal to the open-to-closed-loop handoff threshold when the motor is transitioning into closed loop. However, if the motor is locked, the motor speed is not able to match the open-loop drive rate.

If the motor BEMF is not detected for one electrical cycle after the open-loop drive rate exceeds the threshold, then the open loop was unsuccessful as a result of a locked-rotor condition.

**8.4.8.6 Lock5: Closed Loop Motor Stuck Lock**

If the motor suddenly becomes locked, motor speed and Ktc are not able to be refreshed because the BEMF zero cross of the motor may not appear after the lock. In this condition, lock can also be detected by the following scheme: if the current commutation period is 2x longer than the previous period.

### 8.4.9 Anti Voltage Suppression Function

When a motor is driven, energy is transferred from the power supply into the motor. Some of this energy is stored in the form of inductive energy or as mechanical energy. The DRV10983-Q1 device includes circuits to prevent this energy from being returned to the power supply, which could result in pumping up the  $V_{CC}$  voltage. This function is referred to as the AVS and acts to protect the DRV10983-Q1 device as well as other circuits that share the same  $V_{CC}$  connection. Two forms of AVS protection are used to prevent both the mechanical energy and the inductive energy from being returned to the supply. Each of these modes can be independently disabled through the register configuration bits AVSMEn and AVSIndEn.

#### 8.4.9.1 Mechanical AVS Function

If the speed command suddenly drops such that the BEMF voltage generated by the motor is greater than the voltage that is applied to the motor, then the mechanical energy of the motor is returned to the power supply and the  $V_{CC}$  voltage surges. The mechanical AVS function works to prevent this from happening. The DRV10983-Q1 device buffers the speed command value and limits the resulting output voltage,  $U_{MIN}$ , so that it is not less than the BEMF voltage of the motor. The BEMF voltage in the mechanical AVS function is determined using the programmed value for the motor  $K_t$  ( $K_t[6:0]$ ) along with the speed. Figure 35 shows the criteria used by the mechanical AVS function.

Figure 35. Mechanical AVS

The mechanical AVS function can operate in one of two modes, which can be configured by the register bit AVSMMd:

AVSMMd = 0 – AVS mode is always active to prevent the applied voltage from being less than the BEMF voltage.

AVSMMd = 1 – AVS mode becomes active when  $V_{CC}$  reaches 24 V. The motor acts as a generator and returns energy into the power supply until  $V_{CC}$  reaches 24 V. This mode can be used to enable faster deceleration of the motor in applications where returning energy to the power supply is allowed.

#### 8.4.9.2 Inductive AVS Function

When the DRV10983-Q1 device transitions from driving the motor into a high-impedance state, the inductive current in the motor windings continues to flow and the energy returns to the power supply through the intrinsic body diodes in the FET output stage (see Figure 36).

Figure 36. Inductive-Mode Voltage Surge

To prevent the inductive energy from being returned to the power supply, the DRV10983-Q1 system transitions from driving to a high-impedance state by first turning off the active high-side drivers, and then after a fixed period of time ( $BrkDoneThr[2:0]$ ), turning off the low-side drivers (see Figure 37).

**Figure 37. Inductive AVS**

In this example, current is applied to the motor through the high-side driver on phase U (S1) and returned through the low-side driver on phase W (S6). The high-side driver on phase U is turned off and after a period of time (to allow the inductive energy in the resulting LR circuit to decay) the low-side driver on phase W is turned off. If  $\text{BrkDoneThr}[2:0] = 000$ , no brake will be applied and the device will not protect from inductive energy even with the inductive AVS feature enabled.

#### 8.4.10 PWM Output

The DRV10983-Q1 device has 32 options for PWM dead time. These options can be used to configure the time between one of the bridge FETs turning off and the complementary FET turning on.  $\text{Deadtime}[4:0]$  can be used to configure dead times between 40 and 1280 ns. Take care that the dead time is long enough to prevent the bridge FETs from shooting through.

The DRV10983-Q1 device offers two options for PWM switching frequency. When the configuration bit  $\text{PWMFreq}$  is set to 0, the output PWM frequency is 25 kHz, and when  $\text{PWMFreq}$  is set to 1, the output PWM frequency is 50 kHz.

#### 8.4.11 FG Customized Configuration

The DRV10983-Q1 device provides information about the motor speed through the *frequency generate* (FG) pin. FG also provides information about the driving state of the DRV10983-Q1 device.

##### 8.4.11.1 FG Output Frequency

The FG output frequency can be configured by  $\text{FGcycle}[3:0]$ . The default FG toggles once every electrical cycle ( $\text{FGcycle} = 0000$ ). Many applications configure the FG output so that it provides two pulses for every mechanical rotation of the motor. The configuration bits provided in the DRV10983-Q1 device can accomplish this for 2-pole, 4-pole, 6-pole, and 8-pole motors up to 32-pole motors. This is illustrated in [Figure 38](#) for 2, 4, 6, and 8-pole motors.

[Figure 38](#) shows the DRV10983-Q1 device has been configured to provide FG pulses once every electrical cycle (4 poles), twice every three electrical cycles (6 poles), once every two electrical cycles (8 poles), and once every three electrical cycles (12 poles).

Note that when it is set to two FG pulses every three electrical cycles, the FG output is not 50% duty cycle. Motor speed is able to be measured by monitoring the rising edge of the FG output.

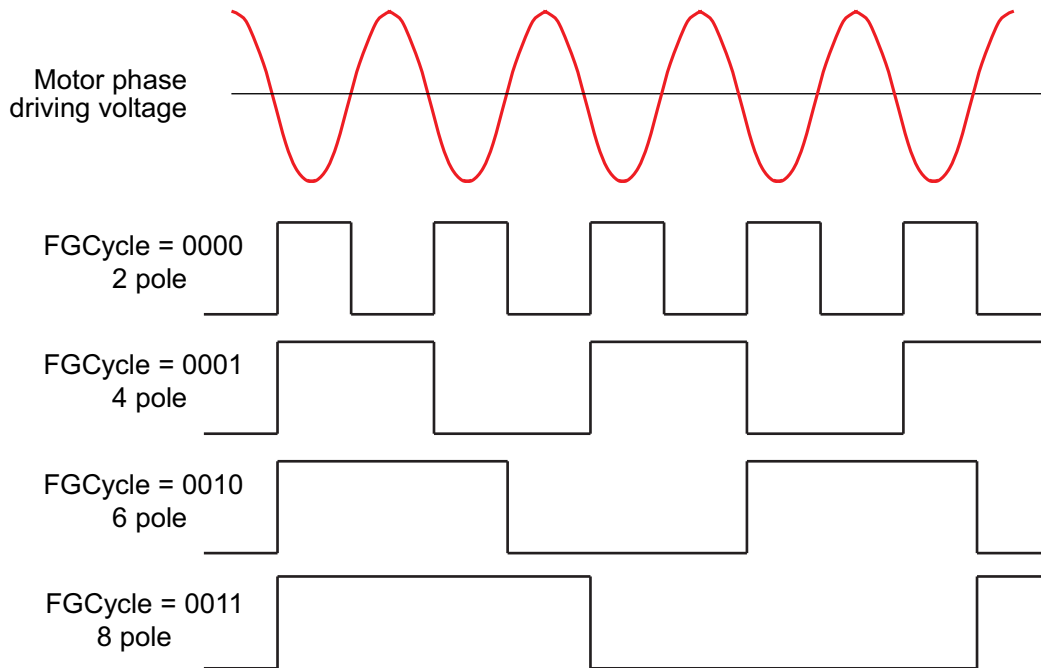

Figure 38. FG Frequency Divider

#### 8.4.11.2 FG Open Loop and Lock Behavior

Note that the FG output reflects the driving state of the motor. During normal closed-loop behavior, the driving state and the actual state of the motor are synchronized. During open-loop acceleration, however, this may not reflect the actual motor speed. During a locked-motor condition, the FG output is driven high.

The DRV10983-Q1 device provides three options for controlling the FG output during open loop, as shown in [Figure 39](#). The selection of these options is determined by the FGOLSel[1:0] setting.

- Option0: Open-loop, FG output based on driving frequency
- Option1: Open-loop, no FG output (keep high)
- Option2: FG output based on driving frequency at the first power-on startup, and no FG output (keep high) for any subsequent restarts

**Figure 39. FG Behavior During Open Loop**

### 8.4.12 Diagnostics and Visibility

The DRV10983-Q1 device offers extensive visibility into the motor system operation conditions stored in internal registers. This information can be monitored through the I<sup>2</sup>C interface. Information can be monitored relating to the device status, motor speed, supply voltage, speed command, motor phase-voltage amplitude, fault status, and others. The data is updated on the fly.

#### 8.4.12.1 Motor-Status Readback

The motor FaultReg register provides information on overtemperature (OverTemp), overcurrent (OverCurr), and locked rotor (Lock0–Lock5).

#### 8.4.12.2 Motor-Speed Readback

The motor operation speed is automatically updated in register MotorSpeed while the motor is spinning. The value is determined by the period for calculated BEMF zero crossings on phase U. The electrical speed of the motor is denoted as *Velocity (Hz)* and is calculated as shown in [Equation 9](#).

$$\text{Velocity (Hz)} = \{\text{MotorSpeed}\} / 10 \quad (9)$$

As an example consider the following:

MotorSpeed = 0x01FF;

Velocity = 512 (0x01FF) / 10 = 51 Hz

For a 4-pole motor, this translates to:

$$51 \frac{\text{cycles}}{\text{second}} \times \frac{1 \text{ mechcycle}}{2 \text{ cycle}} \times 60 \frac{\text{second}}{\text{minute}} = 1530 \text{ RPM}$$

### 8.4.12.3 Motor Electrical-Period Readback

The motor-operation electrical period is automatically updated in register MotorPeriod while the motor is spinning. The electrical period is measured as the time between calculated BEMF zero crossings for phase U. The electrical period of the motor is denoted as  $t_{ELE\_PERIOD}$  ( $\mu$ s) and is calculated as shown in Equation 10.

$$t_{ELE\_PERIOD} (\mu s) = \{MotorPeriod\} \times 10 \quad (10)$$

As an example consider the following:

MotorPeriod = 0x01FF;

$$t_{ELE\_PERIOD} = 512 (0x01FF) \times 10 = 5120 \mu s$$

The motor electrical period and motor speed satisfies the condition of Equation 11.

$$t_{ELE\_PERIOD} (s) \times Velocity (Hz) = 1 \quad (11)$$

### 8.4.12.4 Motor Velocity Constant Read Back

For any given motor, the integrated value of BEMF during half of an electronic cycle is a constant, Ktc (see [Lock2: Abnormal Kt](#)).

The integration of the motor BEMF is processed periodically (updated every electrical cycle) while the motor is spinning. The result is stored in register MotorKt.

The relationship is shown in .

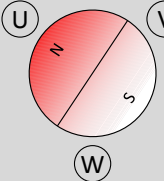

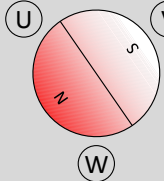

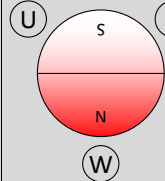

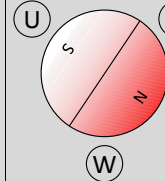

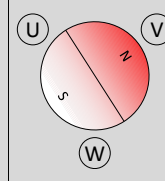

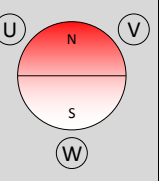

$$Ktc (V/Hz) = \{MotorKt\} / 2 / 1090 \quad (12)$$

### 8.4.12.5 Motor Estimated Position by IPD

After inductive sense is executed, the rotor position is detected within 60 electrical degrees of resolution. The position is stored in register IPDPosition.

The value stored in IPDPosition corresponds to one of the six motor positions plus the IPD advance angle as shown in Table 8. For more information about IPD, see [IPD](#).

Table 8. IPD Position Read Back

						
Rotor position (°)	0	60	120	180	240	300
Data1	0	43	85	128	171	213
IPD advance angle	30	60	90	120		
Data2	22	44	63	85		
Register data	(Data1 + Data2) mod (256)					

### 8.4.12.6 Supply-Voltage Readback

The power supply is monitored periodically during motor operation. This information is available in register SupplyVoltage. The power supply voltage is recorded as shown in Equation 13.

$$V_{POWERSUPPLY} (V) = Supply\ Voltage \times 30\ V / 256 \quad (13)$$

### 8.4.12.7 Speed-Command Readback

The DRV10983-Q1 device converts the various types of speed command into a speed command value (SpeedCmd) as shown in Figure 40. By reading SpeedCmd, the user can observe PWM input duty (PWM digital mode), analog voltage (analog mode), or I<sup>2</sup>C data (I<sup>2</sup>C mode). This value is calculated as shown in Equation 14.

Equation 14 shows how the speed command as a percentage can be calculated and set in SpeedCmd.

$$\text{Duty}_{\text{SPEED}} (\%) = \text{SpeedCmd} \times 100 / 255$$

where

- Duty<sub>SPEED</sub> = Speed command as a percentage
  - SpeedCmd = Register value
- (14)

### 8.4.12.8 Speed-Command Buffer Readback

If acceleration current limit and AVS are enabled, the PWM duty cycle output (read back at spdCmdBuffer) may not always match the input command (read back at SpeedCmd) shown in Figure 40. See [Anti Voltage Suppression Function](#) and [Current Limit](#).

By reading the value of spdCmdBuffer, the user can observe buffered speed command (output PWM duty cycle) to the motor.

Equation 15 shows how the buffered speed is calculated.

$$\text{Duty}_{\text{OUTPUT}} (\%) = \text{spdCmdBuffer} \times 100 / 255$$

where

- Duty<sub>OUTPUT</sub> = The maximum duty cycle of the output PWM, which represents the output amplitude in percentage.
  - spdCmdBuffer = Register value
- (15)

**Figure 40. SpeedCmd and spdCmdBuffer Registers**

### 8.4.12.9 Fault Diagnostics

See [Lock Detect and Fault Handling](#).

## 8.5 Register Maps

### 8.5.1 I<sup>2</sup>C Serial Interface

The DRV10983-Q1 device provides an I<sup>2</sup>C slave interface with slave address 101 0010. TI recommends a pullup resistor of 4.7 kΩ to 3.3 V for I<sup>2</sup>C interface ports SCL and SDA. The protocol for the I<sup>2</sup>C interface is given in Figure 41.

I2C Write

I2C Read

Figure 41. I<sup>2</sup>C Protocol

Seven read/write registers (0x30:0x36) are used to set motor speed and control device registers and EEPROM. Device operation status can be read back through nine read-only registers (0x0:0x08). Another seven EEPROM registers (0x90:0x96) can be accessed to program motor parameters and optimize the spin-up profile for the application.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The DRV10983-Q1 device is used in sensorless 3-phase BLDC motor control. The driver provides a high-performance, high-reliability, flexible, and simple solution for appliance fan, pump, and HVAC applications. The following design shows a common application of the DRV10983-Q1 device.

### 9.2 Typical Application

**Figure 67. Typical Application Schematic**

#### 9.2.1 Design Requirements

[Table 36](#) provides design input parameters and motor parameters for system design.

## Typical Application (continued)

**Table 36. Recommended Application Range**

		MIN	TYP	MAX	UNIT
Motor voltage		6.2	12	28	V
Motor velocity constant	Phase to phase, measured while motor is coasting	0.001		1.8	V/Hz
Motor resistance	1 phase, measured ph-ph and divided by 2	0.3		19	$\Omega$
Motor electrical constant	1 phase; inductance divided by resistance, measured ph-ph is equal to 1 ph	100		5000	$\mu$ s
Operating closed loop speed	Electrical frequency	1		1000	Hz
Motor operating current (RMS)		0.1		2	A
Absolute maximum current	During start-up or locked condition			3	A

**Table 37. External Components**

COMPONENT	PIN 1	PIN 2	RECOMMENDED
$C_{VCC}$	$V_{CC}$	GND	10- $\mu$ F ceramic capacitor rated for $V_{CC}$
$C_{VCP}$	VCP	$V_{CC}$	0.1- $\mu$ F ceramic capacitor rated for 10 V
$C_{CP}$	CPP	CPN	10-nF ceramic capacitor rated for $V_{CC} \times 2$
$L_{SW-VREG}$	SW	VREG	47- $\mu$ H ferrite rated for 1.15A (inductive mode)
$R_{SW-VREG}$	SW	VREG	39- $\Omega$ series resistor rated for ¼ W (resistor mode)
$C_{VREG}$	VREG	GND	10- $\mu$ F ceramic capacitor rated for 10 V
$C_{V1P8}$	V1P8	GND	1- $\mu$ F ceramic capacitor rated for 5 V
$C_{V3P3}$	V3P3	GND	1- $\mu$ F ceramic capacitor rated for 5 V
$R_{SCL}$	SCL	V3P3	4.75-k $\Omega$ pullup to V3P3
$R_{SDA}$	SDA	V3P3	4.75-k $\Omega$ pullup to V3P3
$R_{FG}$	FG	V3P3	4.75-k $\Omega$ pullup to V3P3

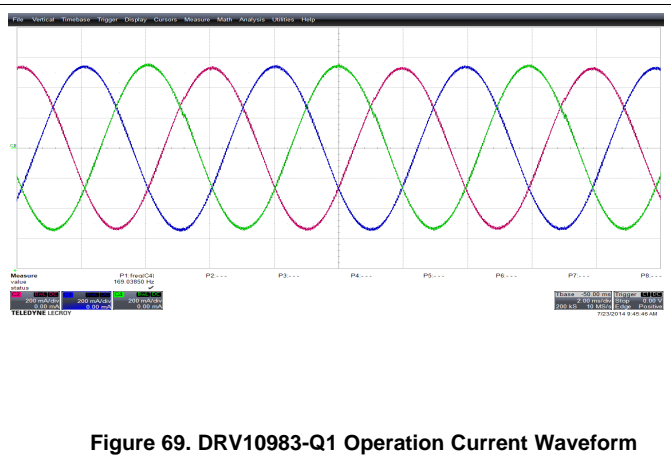

### 9.2.2 Detailed Design Procedure

1. See the [Design Requirements](#) section and make sure your system meets the recommended application range.
2. See the [DRV10983-Q1 Tuning Guide](#) and measure the motor parameters.
3. See the [DRV10983-Q1 Tuning Guide](#). Configure the parameters using the DRV10983-Q1 GUI, and optimize the motor operation. The *Tuning Guide* takes the user through all the configurations step by step, including: start-up operation, closed-loop operation, current control, initial positioning, lock detection, and anti-voltage surge.
4. Build your hardware based on [Layout Guidelines](#).
5. Connect the device into a system and validate your system solution.

### 9.2.3 Application Curves

**Figure 68. DRV10983-Q1 Start-Up Waveform**

**Figure 69. DRV10983-Q1 Operation Current Waveform**

## 10 Power Supply Recommendations

The DRV10983-Q1 device is designed to operate from an input voltage supply,  $V_{CC}$ , in a range between 8 V and 28 V. The user must place a 10- $\mu\text{F}$  ceramic capacitor rated for  $V_{CC}$  as close as possible to the  $V_{CC}$  and GND pins.

If the power supply ripple is more than 200 mV, in addition to the local decoupling capacitors, a bulk capacitance is required and must be sized according to the application requirements. If the bulk capacitance is implemented in the application, the user can reduce the value of the local ceramic capacitor to 1  $\mu\text{F}$ .

## 11 Layout

### 11.1 Layout Guidelines

- Place the  $V_{CC}$ , GND, U, V, and W pins with thick traces because high current passes through these traces.
- Place the 10- $\mu\text{F}$  capacitor between  $V_{CC}$  and GND, and as close to the  $V_{CC}$  and GND pins as possible.
- Place the capacitor between CPP and CPN, and as close to the CPP and CPN pins as possible.
- Connect the GND, PGND, and SWGND under the thermal pad.
- Keep the thermal pad connection as large as possible, on both the bottom side and top sides. It should be one piece of copper without any gaps.

### 11.2 Layout Example

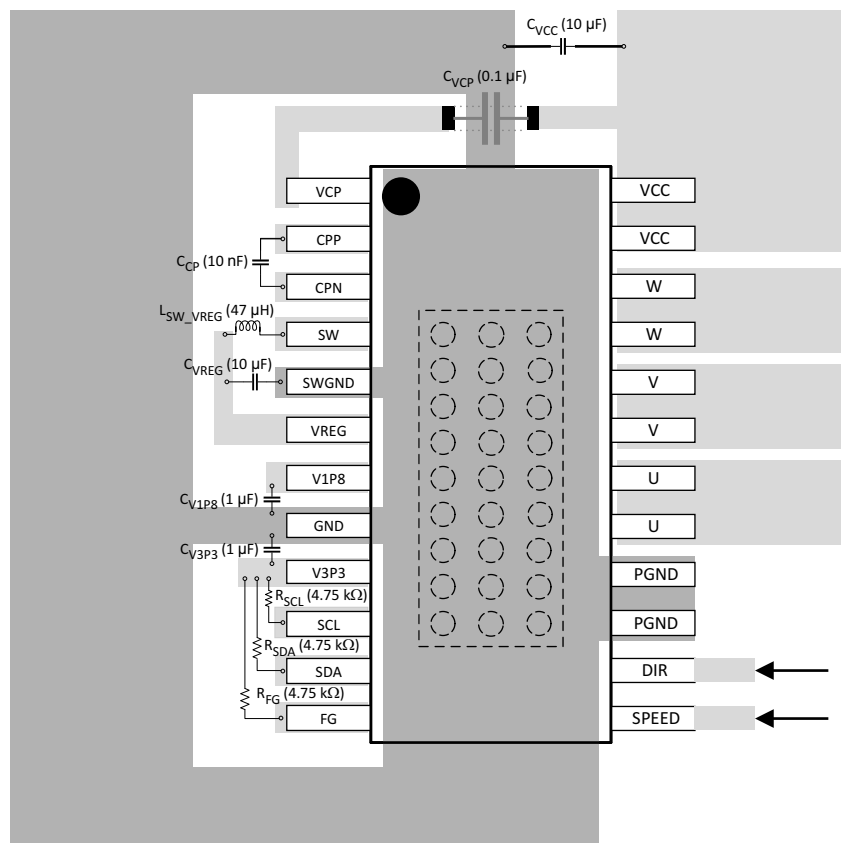

Figure 70. Layout Diagram

## 12 Device and Documentation Support

### 12.1 Trademarks

PowerPAD, E2E are trademarks of Texas Instruments.  
is a trademark of ~other.

### 12.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 12.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 12.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 12.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated devices. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DRV10983QPWPRQ1	ACTIVE	HTSSOP	PWP	24	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 125	DRV10983Q	<a href="#">Samples</a>
DRV10983SQWPRQ1	ACTIVE	HTSSOP	PWP	24	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 125	10983SQ1	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# THERMAL PAD MECHANICAL DATA

## PWP (R-PDSO-G24) PowerPAD™ SMALL PLASTIC OUTLINE

### THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

4206332-46/AO 01/16

NOTE: A. All linear dimensions are in millimeters

 B. Exposed tie strap features may not be present.

PowerPAD is a trademark of Texas Instruments

PWP (R-PDSO-G24)

PowerPAD™ PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste.
  - F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
